

- 1) We have an M-box2 mini which has stopped working (buzz and hum when recording). What 2 channel hardware exists nowadays around the same quality/price which runs ProTools?
- 2) We have a Digidesign 003 Rack 8ch which also has some problems. What is the best replacement ProTools compatible hardware with 8 channels and Optical in/out, around the same quality/price range?
- 3) I am currently using the stereo-out on my motherboard to send the audio signal to a Sony TA-FA3ES amplifier (very old). What DAC and amplifier options do you suggest (given a medium cost limit)? The speakers that we have available are no too bad as you might remember, so I was thinking for the moment to get just the DAC & amplifier.
- 4) We are looking for a very small mini voice/music recorder for the talks that our Elder Efraim does. It is important firstly, that the quality is quite good as it is for the Elder, secondly that the device is as small as possible, but the price can be a little more than the standard devices on the market (maybe up to 400E).
- 5) We need a small 4ch mixer which gives phantom power and preferably has only volume controls (not the whole settings that some might have – EQ, reverb, inserts etc.). Also we need it to have 2 audio outputs. I was looking at the Behringer MicroMix MX400 which is really simple but it has only 1 output. We want something similar but a bit better. Is there anything that you are aware of that you can suggest?
